# Learning Journal 1.1

1.  The first experiences that I have had with programming is when I first started the course "Full Stack Web Development" at CareerFoundry. I had only known about the basics with HTML, CSS and JavaScript.
    Throughout that course I have been able to develop my problem-solving skills, how to debug and use testing tools.

2.  After digging more into the web development world I encountered "Python". It amazed me how versatile it is and the capabilities it has. I took a small course to learn the basics of Python.

3.  Essentially starting to learn a new programming language will be a challenge and understanding why things are done a certain way. I believe that being able to join a Python community such as in Discord or other social accounts will help me solve any doubts that I have. Trying to connect with people in the same field that I would like to be in will also help me achieve my goals.

4.  In this first exercise I learned how to install Python in my local environment and also about the creation of virtual environments where I initially started with issues; not being able to switch from local virtual environments and/or activating the ones already created.

    In the long run I will want to be an expert knowing all the fundamentals and concepts of Python and being able to start building simple applications without any hassle.
